# COMPANY OVERVIEW

- 01. Corporate Profile
- 02. Corporate Identity

# 01. Corporate Profile

**CEO**  
Seong-Wook Lee

**Founding Date**  
29 Aug 2017

**Ownership %**  
Management & Executives 19.3%,  
Institutional Investors 70.2%, Others 10.5%

**Key Business Areas**  
Research and Development (R&D) in Medical  
Sciences and Pharmaceuticals

**Location**  
Headquarter : #801, C Building, Pangyo Innovalley, 253, Pangyo-ro, Bundang-gu, Seongnam-si, Gyeonggi-do, 13485, Korea  
R&D Center : #803, the same building

**Rznomics**

**The First Company Owns RNA  
Multi-Editing Platform**

\* As of the end of 1Q 2026

## 2017~2020

- Corporate Founded (2017.08.29)
- Seed Funding (KRW 0.2 bil.)
- Pre-A Funding (KRW 1 bil.)
- Series A Funding (KRW 1.2 bil.)
- R&D Center Founded / Certificated
- Venture Business Certificated

## 2021~2023

- Series B Funding (KRW 10.5 bil.)
- Series C Funding (KRW 37.2 bil.)
- RZ-001 (HCC) MFDS & FDA Phase 1/2a IND approved
- RZ-001 Combination (HCC) MFDS Phase 1b/2a IND Approval
- RZ-001 (GBM) MFDS & FDA Phase 1/2a IND Approval
- RZ-001 (GBM) FDA Fast Track Designation
- Contracted a Free Supply of Immunotherapy for RZ-001 Combination (HCC) Clinical Trial with Roche

## 2024~

- Pre-IPO Funding (KRW 20.3 bil., **Total Investment KRW 81.2 bil**)
- RZ-001 Combination (HCC) FDA Phase 1b/2a IND Approval
- RZ-001 (GBM) FDA Expanded Access Program Approval
- RZ-004 (RP) Australia TGA Phase 1/2a IND Approval
- RZ-001 (GBM) FDA Orphan Drug Designation
- RZ-001 (HCC) FDA Orphan Drug & Fast track Designation
- **The First and Only Company Certified as National Strategic Technology by the Korean Government.**
- Contracted a Free Supply of Immunotherapy with Celltrion
- **Contracted a License Agreement with Eli Lilly**
- Passed Technology Evaluation (Rating: A, A)
- Listed on KOSDAQ (18 Dec 2025)

## Awards List

- Sep 2022 : Asia-Pacific Cell & Gene Therapy Excellence Awards
- Sep 2023 : Asia-Pacific Cell & Gene Therapy Excellence Awards
- Dec 2023 : The 50 best R&D Achievements of Small/Medium-sized Enterprises
- Dec 2023 : Award from Korean Government (Ministry of SMEs and Startups)
- Dec 2023 : Won in Deep-tech Open Innovation Challenge
- Sep 2024 : Korea Innovation and Startup Award
- Nov 2024 : Commendation from the Ministry of Health and Welfare

## 02. Corporate Identity

Global Leader of Trans-splicing Ribozyme based Therapeutics Developers

### Ribozyme and omics

First-in-Class gene therapies for diverse unmet medical needs  
Developing innovative therapies with RNA-based platform technology

#### Korea's Only RNA Editing Company

Trans-splicing ribozyme-based RNA editing platform and target disease related RNA-specific gene therapy technology

Systematic and efficient drug development based on proprietary know-how

Expansion of a new circular RNA platform based on Trans-splicing ribozyme

- The First and Only company certificated as National Strategic Technology by Korean government (Ministry of Science and ICT)

#### Expandable Pipelines for Oncology and Intractable Diseases

Innovative gene therapy pipelines for high medical unmet needs

Indication database utilizing RNA editing technology

Expanding pipelines by new target RNA discovery

- KR MFDS / US FDA IND approval for oncology (6 cases)
- Fast Track & ODD for oncology (4 cases)
- AU TGA IND approval for genetic disorder (1 case)

#### Licensing-Out with Global Big Pharma

Market growth for innovative gene therapies for rare and intractable disease

An RNA level Gene therapy capable of treating diseases that are inaccessible by previous treatments

RNA platform to meet big pharma's needs

- Clinical collaboration with Roche, Celltrion
- Multiple option deal signed with Eli Lilly (up to \$1.3 b)
- Research collaborations with global therapeutics and delivery vehicle developers

2

## CORE COMPETENCY

- 01. RNA Editing Platform
- 02. Unique aspects of Technology
- 03. Circular RNA Platform

# 01. RNA Editing Platform : Diversification of Gene Therapy Technologies

Technological Advancements are driving the diversification of Modalities

# 01. RNA Editing Platform : Trans-splicing Ribozyme

Target RNA Cleavage, Therapeutic RNA Splicing, Treatment with a Single Agent

- Specific activation of target RNA → High target specificity
- RNA cleavage, splicing and expression: Triple-function
- Protein expression from modified RNA → Therapeutic efficacy

# 01. RNA Editing Platform : Trans-splicing Ribozyme

**Trans-Splicing Ribozyme** based on Tetrahymena group I intron

- ✓ Specificity by specific RNA-sensing riboswitch
- ✓ Efficacy by dual function of RNA-cleavage & transgene induction

Group I intron 2D(L), 3D(R) structure

# 01. RNA Editing Platform : Trans-splicing Ribozyme

RNA Platform with Expandability · Safety · Efficiency

## (1) Excellent Expandability

**RNA Mapping technology**  
In-house screening system that identifies the most effective trans-splicing ribozyme for a target in a single experiment

## (3) RNA Expression Control

- Mir- T: Selective regulation of ribozyme expression
- WPRE : Enhances intracellular RNA stability and gene expression
- SD/SA : Increases RNA transcription efficiency

## (2) Maximizing Its Characteristic

- P1: Increases based pairing with the target RNA
- P10 : Maximizing ligation efficiency of target site and therapeutic RNA
- AS : Maximizing target specificity / minimizing off-targets

## (4) Delivery Vector Optimization

## Development & Optimization Flow

| Development stage           | 1 Target Selection              | 2 Identification of Target-specific TSR | 3 TSR Optimization         | 4 Vector Optimization                          | 5 Delivery Vehicle Screening                              | 6 Candidate Identification |
|-----------------------------|---------------------------------|-----------------------------------------|----------------------------|------------------------------------------------|-----------------------------------------------------------|----------------------------|
|                             |                                 |                                         |                            |                                                |                                                           |                            |
| Applied platform technology | Criteria based target selection | RNA Mapping                             | TSR structure optimization | TSR expression, safety, stability optimization | Virus vector screening (delivery efficiency optimization) |                            |

## 02. Unique Aspects of the Technology

Targeting upstream of known mutations enable a single treatment to edit all mutation sites

|                 |                                           |                                                                                                                                       |
|-----------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Differentiation | Diseases-associated RNA-specific Target   | Diseases-associated RNA-specific Target → Targeting Non-druggable target                                                              |
|                 | One Molecule-Dual Function                | A single molecule simultaneously suppresses target RNA and activates diseases-specific therapeutic gene                               |
|                 | Regulation on Therapeutic Gene Expression | Therapeutic gene expression proportion to target RNA levels → Maintain endogenous cellular RNA expression level                       |
|                 | Continuous Expression Level Modulation    | Possible to achieve sustained modulation of expression levels in cells using a DNA vector as a tool.                                  |
| Excellence      | High Performance                          | Operates via RNA-intrinsic mechanism → High specificity, efficiency, and safety; precise editing rates; minimal off-target effects    |
|                 | Gene Editing at RNA Level                 | Editing RNA mutation sites in RNA level → Minimize Genome toxicity and/or permanent genomic alteration                                |
|                 | Variable Mutation Site Targetable         | Upstream targeting of mutation sites → A single therapy to edit and treat diverse mutation sites                                      |
| Expandability   | Modular Engineering                       | Applicable to diverse indications (platform and pipeline expandability), wide applicability; imaging /theragnostic /cell therapy etc. |

### 03. Circular RNA Platform : Development of New Platform

|                                                                                    |                   |                                                               |
|------------------------------------------------------------------------------------|-------------------|---------------------------------------------------------------|
|  | <b>Stability</b>  | A closed-loop RNA structure without exposed ends              |
|  | <b>Safety</b>     | Comparable efficacy at lower doses compared to linear RNA     |
|  | <b>Efficiency</b> | Proximal start-stop codon arrangement – efficient translation |

Rausch J. W. (2021). Synthesising circular RNA is as easy as PIE.

**Self-circularization construct**  
(End-to-End Self Targeting & Splicing, STS)

#### Possible applications of Circular RNA

- mRNA therapeutics
- mRNA vaccine (prophylaxis, anti-cancer)
- Protein expressing mRNA for the CAR-T cell treatments
- Anti-miRNA treatments

→ A next-generation RNA platform as an alternative to linear RNA

#### Fundamental patents of Circular RNA

- Registered : KOR(10-2242946), US(11,939,580), JP(7531237), AUS(2022234607)
- FTO analysis completed

## 03. Circular RNA Platform : Next-generation Platform

### Benefits of RNA Therapeutics

Non-genotoxicity

Unlike DNA, RNA do not integrate into the human genome

Chemical Control

Immunogenicity and stability can be controlled through chemical modifications

Repeated Administration

Repeated dosing is possible due to low immunogenicity

Systemic Administration

Deliverable to specific cells or tissues systemically by leveraging carrier technologies

Easy Production

Rapid manufacturing via chemical synthesis or IVT → **Adaptable for therapeutic applications**

Therapeutic Gene Expression

**Direct protein expression via mRNA therapeutics, bypassing DNA transcription**

### Circular RNA : Trans-splicing Ribozyme Technology-based Next Platform

- Advantages of RNA therapeutics
- Overcoming limitations of virus-based gene therapies, such as viral immunogenicity and restrictions on repeat administration
- Fundamental patent secured / FTO analysis completed → **Proprietary next RNA platform**, which allows for free implementation

# 01. R&D Pipeline

Pipelines Focused on Indications with Strong Commercial Potential with Optimized Trans-splicing Ribozymes

\* Expanded Access Program : a potential pathway for a patient with a serious or immediately life-threatening disease or condition to gain access to an investigational medical product (drug, biologic, or medical device) for treatment outside of clinical trials when no comparable or satisfactory alternative therapy options are available.

\*\* The areas marked with a dotted line of RZ-003, RZ-004 is the stage when research and development collaboration with partners is planned after licensing out.

## 02. RZ-001 : Cancer Therapy

High Anticancer Efficacy through Multiple Mechanisms, Enabling Expansion of Indications to Various Cancer Types

### RZ- 001: MOA

#### hTERT

(human telomerase reverse transcriptase)

#### Targeting hTERT,

**expressed in 80 – 90% of tumors**

enables application across heterogenous cancers

### Indication Expansion

#### RZ-001

Applicable to all TERT-expressing cancers

#### HCC treatment market

#### High Mortality Rate

- Hepatocellular carcinoma, a leading cause of death
- 50% of cases diagnosed as advanced liver cancer
- 90% of cases with advanced liver cancer have liver cirrhosis

#### RZ-001 (CI combination Phase 1b/2a ongoing)

- Targeting intermediate to advanced stage HCC patients (60% of the total HCC population)
- US FDA Orphan Drug Designation (Jan 24), Fast Track (Feb 25)

#### GBM treatment market

#### High Mortality Rate

- Median Overall Survival : 12-15 months, 5-year Survival Rate : less than 3-5%
- 50% of patients succumb within 1 year, 90% within 3 years

#### RZ-001 (monotherapy Phase 1/2a ongoing)

- Over 75% of the total GBM patient population have hTERT expression
- US FDA Orphan Drug Designation (Oct 24), Fast Track (Nov 23) Expanded Access Program (Oct 24)

Source2 : Glioblastoma (GBM) Disease Coverage, Data monitor Healthcare

## 02. RZ-001: HCC, Hepatocellular Carcinoma

### Clinical Overview (US FDA Fast Track/ODD)

\* ODD: Orphan Drug Designation

**Free supply of combination drugs from global pharmaceutical companies**

#### Potential Partners

**We will await your outreach for the HCC clinical trials**

**Fast Track, ODD designation**

## 02. RZ-001: GBM, Glioblastoma

### Clinical Overview (US FDA Fast Track / ODD / EAP)

\* ODD: Orphan Drug Designation, EAP: Expanded Access Program

**HARVARD**  
MEDICAL SCHOOL

Dr. E. Chiocca  
Harvard Medical School  
of Medicine

Providing a potential new treatment option for GBM patients with limited alternatives

**U.S. FOOD & DRUG**  
ADMINISTRATION

Fast Track, ODD designation

### 03. RZ-003 : AD, Alzheimer's Disease

#### Inhibition of APOE4 RNA Expression & Therapeutic RNA Expression

Source 1: Golden et al. 2025

#### RZ-003 : AD RNA Therapy

Cleavage of APOE4 RNA & replacement with therapeutic RNA

**APOE4 RNA reduction + therapeutic RNA expression**

- ✓ Multi-payload efficacy
- ✓ Multi-targeting
- ✓ Modular engineering
- ✓ Early intervention
- ✓ Fundamental disease-modification

#### RZ-003, in vivo Gene Expression

## 04. RZ- 004 : RP, Retinitis Pigmentosa

Potential for Fundamental Cure via Diverse Mutation Editing & Normal Gene Expression

### RP Treatment Market

### Key Genetic Mutations

15-25% of all patients are classified as an autosomal dominant type, among them **27.9%** of with RHO mutations

Source1 : [www.towardshealthcare.com](http://www.towardshealthcare.com)

Source2 : Tsang, S.H., Sharma, T., Atlas of Inherited Retinal Diseases, 2018

Source3 : Sara J Bowne et al., 2008

### Medical Unmet Needs

- Over 150 mutation sites identified beyond P23H in Exon1
- Continuous discovery of new mutation sites → High demand for targeting multiple mutations

### RZ-004 MOA

Recovery beyond just delaying disease progression by inhibiting abnormal protein & inducing normal protein expression

## 04. RZ- 004 : RP, Retinitis Pigmentosa

Verified its Therapeutic Potential via Key Figure Improvements of Two Variant Models

### RZ-004 Non-clinical Overview

#### Preclinical Efficacy Results for In vivo Vision

- Two KI disease mouse models of human RHO mutation (P23H / Q344X)
- \*ERG measurements taken 26 weeks after sub-retinal injection of RZ-004 : increased \*B-waves in the RZ-004 treatment group
- Significant vision restoration by RZ-004 of animal model
- Multi-editing effect of a single treatment

##### (1) Human P23H RHO KI mouse model

##### (2) Human Q344X RHO KI mouse model

#### for In vivo Retinal Structure

- Vision restoration due to maintenance of significant ONL status
- Consistent maintenance of ONL in the area where the ribozyme has expressed

\* ERG (Electroretinogram) : A diagnostic test that measures the electrical response of the retina to light by using electrodes placed on the cornea or skin near the eye.

\* B-wave : A waveform measured in an ERG, indicating visual signal transmission function.

\* ONL (Outer Nuclear Layer): A layer of the vertebrate retina that contains the nuclei of rod and cone photoreceptor cells. Preservation is an indicator of cell survival.

## 05. RZ-005 : RTT, Rett Syndrome

Maintaining the Golden Balance: Natural Expression Regulation for Safe Rett Syndrome Therapy

### Rett Syndrome Treatment Market

### Advantages of RZ-005

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| ✓ <b>mutMeCP2Target</b>       | Induction of WT MeCP2 gene expression                                                                 |
| ✓ <b>MeCP2expressionlevel</b> | maintain endogenous expression level                                                                  |
| ✓ <b>MeCP25'UTRTargeting</b>  | All mutations can be targeted with a single therapeutic agent                                         |
| ✓ <b>Multi-function</b>       | Removal of mutant protein and simultaneous expression of WT protein                                   |
| ✓ <b>Safety</b>               | Gene correction at RNA level (minimizing genome toxicity)<br>No Extra protein introduction/expression |
| ✓ <b>EarlyIntervention</b>    | Early initiation of therapeutic intervention enabled through MeCP2 genetic screening                  |

### MECP2 Gene and Mutation

### Gene Location and Composition

#### •Chromosomal Location:

The *MECP2* gene is located on the reverse strand of the X chromosome

#### •Structure and Variants:

Spanning approximately 10,505 bp, the gene consists of 4 exons and produces two protein variants, e1 and e2, through alternative splicing.

### Mutation Patterns

#### •Pathogenic Mutations:

Key mutations are primarily concentrated in the Methyl-DNA Binding (MDB) domain and the C-terminal end of the Transcriptional Repression Domain (TRD).

#### •Non-Pathogenic Variants:

Functional mutation sites also exist within the gene that do not lead to the development of Rett syndrome.

## 05. Platform-based Expansion Strategy

Competitive / Differentiable Indications Targeting

## 06. Decision Tree for Target Selection

4

## Business Strategy

# Strategic Partnership

Expanding Partnership Opportunities

# Business Strategy

Accelerating Growth through Three Types of Business Model

## Platform Deal

Licensing of development and commercialization rights for candidates developed using Rznomics' platform technology

## Pipeline Deal

Licensing of individual pipeline assets

## IP Deal

Patent-based IP rights transfer to partners for drug development and commercialization

**Rznomics Inc.**

Specialized in developing  
**RNA-based**  
biopharmaceuticals
